

ChartRunner

Trade the chart. Survive the upside-down.

Gamified trading SDK · Solana devnet · single-file MVP

Trading apps are a hospital monitor.

74%

of new retail traders quit
within their first 90 days

Source: Brokerchooser, 2024

Why they quit

- **Hospital-monitor UX**

12 panels, 100 numbers, an order ticket asking for real money before they understand what any of it means.

- **No skill loop**

YouTube and PDFs are passive. Paper trading is fake money on the same scary screen. Nothing transfers.

- **On-ramp is a cliff**

Skill required to start $\approx$ skill required to be profitable. Beginners can't get past minute one.

Turn the cliff into a game.

Game first

Real Binance candles. Three avatar physics modes. Walk the chart, fall through the close, fight bears in the upside-down. Every input has visible feedback.

Real primitives

Bracket. Ladder. OCO. Hedge. Radar. Rescue. Six trading primitives wired as in-game abilities — not toy versions.

SDK is the bridge

Every primitive routes through ChartRunnerSDK. The same SDK we plug into Solana devnet for live trades. What you practice is what graduates.

The constitutional rule: **abilities never touch the canvas. The SDK is the only thing that issues orders.**

Phase 0 MVP — playable now.

Single file. Zero install.

ChartRunner_Prototype.html

open it in your browser. that's the install.

What ships in Phase 0

- ✓ **Three avatar physics** Runner · Flight · Upside-down
- ✓ **Six trading primitives** Bracket · Ladder · OCO · Hedge · Radar · Rescue
- ✓ **Two-anchor laser placement** Click two candles to land any tool
- ✓ **Workbench Pine builder** Bots · Strategies · Indicators · Backtest · Apps
- ✓ **Multi-tracker Terminal** Darkflow · Hyper · Solana · CEX · Strategies
- ✓ **Drag-to-desktop widgets** Map / chat / pane → live preview
- ✓ **Phone OS overlay** Full-screen mobile mirror
- ✓ **Save / load maps** 30-slot setup recall with thumbnails

Abilities never touch the canvas.

Why this matters

Phase 2 is a swap, not a rewrite. Same SDK call, new adapter. **Players take their muscle memory with them.**

Why now

Two structural shifts.

01

Wallet UX flipped

Phantom + Hyperliquid lowered the on-chain trading on-ramp from days to minutes. A 22-year-old can fund a wallet and place a perp in under 4 minutes. The infrastructure barrier is gone.

02

Memecoin season trained 8M+ wallets

Pump.fun, Bonk, and the post-2024 launch culture taught a generation to swap on-chain. They have wallets. They have liquidity. They don't have a way to learn anything beyond "press buy."

Shipping discipline you can audit.

each parse-validated

each with reasoning in source

Milestones already met

- **Phase 0 MVP**
Single-file playable, 9 OS apps, 5 trackers, 6 SDK primitives
- **Phase 1 SDK skeleton**
ES modules, RiskManager parity tests, demo page
- **M5 Solana paper-mode**
Ed25519 wallet + session + approver + parity vectors
- **Constitutional rule**
Enforced across 230+ commits — SDK never bypassed
- **Public demo URL**
GitHub Pages folder ready (charrunner-prototype/)
- **Pitch package**
Deck + 9 docs + video script + X launch kit

Four wedges nobody else has.

Gamified

TradingView and Phantom aren't.
Learn-by-doing, minute one.

Skill-building

Bitget Quest and Coinbase Learn aren't.
Reps build muscle memory, not trivia.

On-chain native

TradingView Paper isn't.
Phase 2 routes through Solana devnet.

SDK-portable

Every gamified competitor locks the player to one venue.
We drop on any chart.

We are a runtime artifact, not a SaaS. **Distribution asymmetry.**

From single-file demo to live Solana trades.

Phase 0

SHIPPED

- Playable single-file MVP
- Real Binance candles
 - 6 SDK primitives
 - 5 tracker views
 - Workbench Pine builder

Phase 1

ARCHITECTURE DONE

- ChartHost adapter layer
- Drop UI on Dexscreener
 - Drop on TradingView
 - Drop on Birdeye
 - npm @chartrunner/sdk@0.1

Phase 2

PLANNED

- Live Solana devnet
- Phantom-Connect
 - Real on-chain fills
 - P2P creator economy
 - Multi-venue adapters

Three revenue lanes, one runtime.

P2P creator marketplace

5% fee on every Workbench-built bot, strategy, and map sold for \$SOL.

Creator-economy lock-in. TradingView can't match without breaking SaaS.

Game shop

Vehicles, skins, themes priced in \$RUN earned in-run. Free cosmetic loop with paid premium tier.

F2P-style monetization, crypto-native settlement.

White-label license

Per-venue annual license for chart vendors and exchanges that want a gamified onboarding tab.

Phantom · Drift · Hyperliquid · Birdeye are all candidate partners.

The ask

Two open invites.

Phase 0 ships now.

Phase 1 in 90 days with a partner.

Phase 2 in 180 with seed.

1 Devnet integration partner

Hyperliquid · Drift · Phoenix — first-class fit.

We bring the on-ramp; you bring the venue.

Co-signed integration spec, 90-day Phase 1 ship target.

2 Six-month seed

Staffs the Phase 1 SDK extraction + Phase 2 Solana adapter.

1 Solana eng · 1 comms hire · 6 months runway.

Solana foundation grants in flight as parallel track.

The next 10 million traders won't learn from PDFs.

They'll learn from a game.

We're the on-ramp.
